Punnawit Rodsai

punnawit.rod@gmail.com 088-897-2395
Junior Backend / Fullstack Developer 0xpunnawit.netlify.app/ github.com/0xPunnawit

Computer Science Graduate focusing on Backend development with Full-stack flexibility. Experienced in building applications with Node.js and Java, and actively exploring modern backend services using Go (Fiber). Available for contracts, freelance roles, or immediate projects before upcoming military enlistment in April 2027.

SKILLS

Programming Languages: Node.js, TypeScript, Java, Go

Frameworks & Libraries: Express, NestJS, Spring Boot, Fastify, Fiber, Angular

Databases : MySQL, PostgreSQL, OracleDB

Tools : Docker, Podman, DBeaver, Postman, Git, RedHat OpenShift, Xampp, JMeter, ELK

WORK EXPERIENCE

TTB Bank (TMBThanachart) Backend Intern **Dec 2025 – Present (11 Months)**

Digital Document Wallet (VC WALLET) **PRODUCTION**

- Developed secure RESTful APIs to efficiently store, retrieve, and manage digital documents.
- Implemented asynchronous integrations with the NDID platform, handling callbacks and wait states for user identity verification.
- Applied enterprise-level security protocols, including data encryption/decryption, hashing, and digital signatures to ensure document authenticity.
- Formatted and optimized application logs by trimming large payload data fields for clearer error tracking, while conducting API load and performance testing.

NDID BOT Settlement **PRODUCTION**

- Developed an automated batch service to download monthly CSV/XLSX reports for transaction reconciliation.
- Configured isolated multi-database connections to safely process batch data with zero impact on the production database.
- Implemented database transactions for bulk inserts with automatic rollbacks to prevent invalid data if errors occur.
- Integrated automated email alerts to send execution logs, summaries, and failure notifications to system administrators.

Settlement Audit Dashboard (Internal BU Tool) **PRODUCTION**

- Developed an internal web dashboard for Business Unit (BU) staff to audit and verify reconciliation reports.
- Implemented dynamic step-by-step form validation to enforce date range constraints and sequential selection flows.
- Integrated backend REST APIs to handle automated generation and direct browser downloads of audit report files.

LINE OA AI Receipt OCR & Point Donation **Internal POC**

- Developed a scalable backend system to handle webhooks from LINE Official Account (LINE OA) for automated user engagement.
- Implemented secure webhook validation by verifying signatures and headers to block unauthorized requests.
- Built an OCR workflow to process receipt images, extract transaction data, and automatically credit user points.
- Integrated a point donation system that converts user points into team donations via voice commands and internal APIs.
- Implemented Rate Limiting to protect the server from spam requests and ensure system stability.

Trade Finance Service (Doc Check) **Internal POC**

- Engineered a centralized document repository with smart PDF versioning to merge or replace trade finance documents automatically.
- Built secure file streaming services to render multi-page document previews directly on the web interface.
- Integrated OCR and AI pipelines to extract trade finance data and automatically identify document discrepancy fields.
- Developed an interactive report UI featuring synchronized visual highlighting between table data and document locations for clear error tracking.
- Implemented automated report generation allowing users to export structured audit results directly from the discrepancy table.
